

Build Supply Chain Resilience into Your Organization

Minimize Risks, Maximize Rewards

Suppliers are at the heart of many organizations' processes and activities; thus, a comprehensive Supplier Management Program should be a focal point in a Quality Management and Procurement strategy to reduce financial, business, and reputational risks, control costs and support the pursuit of supply chain excellence.

Ideally a Supplier Management program can provide an organization with a wide range of benefits that minimize risk and maximize benefits, including:

1. Improvement in quality of products or services
2. Assurance that a supplier can meet specific standards and specifications
3. Reduction in supply chain disruptions
4. Cost savings through improved efficiency in the Procurement process
5. Enhanced partnership fostering innovation, growth, and continuous improvements

Without proper Supplier Management, companies may face challenges in maintaining consistent quality, leading to customer dissatisfaction and potential damage to company and brand reputation, including:

1. Increased risk exposure
2. Suppliers who do not meet organizational quality and product safety requirements
3. Critical out of stock conditions as the supplier is not able to source the material or product
4. Use of material or product that meets regulatory requirements, however, may deviate from an organization's specifications or strategic initiatives, such as sustainability
5. Increased supplier performance issues with no consequence

Supply chain disruption may no longer present a significant risk, but strong Supplier Management programs will remain essential. Contact RQA to learn more about Supplier:
